PHENYLEPHRINE HYDROCHLORIDE - phenylephrine hydrochloride solution/ drops
Paragon BioTeck, Inc.

HIGHLIGHTS OF PRESCRIBING INFORMATION
These highlights do not include all the information needed to use Phenylephrine Hydrochloride Ophthalmic Solution 2.5% and 10% safely and effectively. See full prescribing information for Phenylephrine Hydrochloride Ophthalmic Solution 2.5% and 10%
Initial U.S. Approval:

INDICATIONS AND USAGE
Phenylephrine Hydrochloride Ophthalmic Solution, USP 2.5% and 10% is an alpha-1 adrenergic receptor agonist indicated to dilate the pupil [1].

DOSAGE AND ADMINISTRATION
For patients 1 year of age and older, apply one drop of Phenylephrine Hydrochloride Ophthalmic Solution, USP 2.5% or 10% at 3 to 5 minute intervals up to a maximum of 3 drops per eye. [2.1]
In pediatric patients less than 1 year of age, one drop of Phenylephrine Hydrochloride Ophthalmic Solution, USP 2.5% should be instilled at 3 to 5 minute intervals up to a maximum of 3 drops per eye. [2.2]

DOSAGE FORMS AND STRENGTHS
2.5% and 10% sterile ophthalmic solutions [3].

CONTRAINDICATIONS
Phenylephrine Hydrochloride Ophthalmic Solution, USP 10% is contraindicated in patients with hypertension, or thyrotoxicosis. Phenylephrine Hydrochloride Ophthalmic Solution, USP 2.5% should be used in these patients. [4.1]
Phenylephrine Hydrochloride Ophthalmic Solution, USP 10% is contraindicated in pediatric patients less than 1 year of age due to the increased risk of systemic toxicity. Phenylephrine Hydrochloride Ophthalmic Solution, USP 2.5% should be used in these patients. [4.2]

WARNINGS AND PRECAUTIONS
Not for injection. Topical ophthalmic use only [5.1]
Reports of serious cardiovascular reactions, some fatal, with phenylephrine hydrochloride 10% solution. Monitor blood pressure in patients with cardiovascular disease [5.2]
Significant elevations in blood pressure have been reported. Caution in pediatric patients less than 5 years of age, and in patients with elevated blood pressure [5.3].
Rebound miosis has been reported one day after instillation [5.4]

ADVERSE REACTIONS
Ocular adverse reactions include eye pain and stinging on instillation, temporary blurred vision and photophobia [6.1].
Cardiovascular adverse reactions include increase in blood pressure, syncope, myocardial infarction, tachycardia, arrhythmia and subarachnoid hemorrhage [6.2].

To report SUSPECTED ADVERSE REACTIONS, contact Paragon BioTeck, Inc. at 1-888-424-1192 or FDA at 1-800-FDA-1088 or www.fda.gov/medwatch

DRUG INTERACTIONS
May exaggerate the adrenergic pressor response in patients taking atropine-like drugs [7.1]
May potentiate the cardiovascular depressant effects of potent inhalation anesthetic agents [7.1]

See 17 for PATIENT COUNSELING INFORMATION.

Revised: 3/2013

FULL PRESCRIBING INFORMATION: CONTENTS*
1 INDICATIONS AND USAGE
2 DOSAGE AND ADMINISTRATION
  2.1 General Dosing Recommendations
  2.2 Pediatric Patients Less Than 1 Year of Age
Phenylephrine Hydrochloride Ophthalmic Solution, 2.5% and 10% is indicated to dilate the pupil.

In patients 1 year of age or greater, apply one drop of either Phenylephrine Hydrochloride Ophthalmic Solution, USP 2.5% or 10% every 3 to 5 minutes to the conjunctival fornix as required up to a maximum of 3 drops. If necessary, this dose may be repeated.

In order to obtain a greater degree of mydriasis, Phenylephrine Hydrochloride Ophthalmic Solution, USP 10% may be needed.

In pediatric patients less than 1 year of age, one drop of Phenylephrine Hydrochloride Ophthalmic Solution, USP 2.5% should be instilled at 3 to 5 minute intervals up to a maximum of 3 drops per eye.
3 DOSAGE FORMS AND STRENGTHS
Phenylephrine Hydrochloride Ophthalmic Solution, 2.5% is a clear, colorless, sterile topical ophthalmic solution containing phenylephrine hydrochloride 2.5%.
Phenylephrine Hydrochloride Ophthalmic Solution, 10% is a clear, colorless, sterile topical ophthalmic solution containing phenylephrine hydrochloride 10%.

4 CONTRAINDICATIONS
4.1 Cardiac and Endocrine Disease
Phenylephrine Hydrochloride Ophthalmic Solution, USP 10% is contraindicated in patients with hypertension or thyrotoxicosis. Phenylephrine Hydrochloride Ophthalmic Solution, USP 2.5% should be used in these patients.

4.2 Pediatric Patients Less Than 1 Year of Age
Phenylephrine Hydrochloride Ophthalmic Solution, USP 10% is contraindicated in pediatric patients less than 1 year of age due to the increased risk of systemic toxicity. Phenylephrine Hydrochloride Ophthalmic Solution, USP 2.5% should be used in these patients [See Dosage and Administration section].

5 WARNINGS AND PRECAUTIONS
5.1 Topical Ophthalmic Use Only
Phenylephrine Hydrochloride Ophthalmic Solution, 2.5% and 10% is not indicated for injection.

5.2 Cardiovascular Reactions
There have been reports of serious cardiovascular reactions, including ventricular arrhythmias and myocardial infarctions, in patients using phenylephrine 10%. These episodes, some fatal, have usually occurred in patients with pre-existing cardiovascular diseases. Phenylephrine Hydrochloride Ophthalmic Solution, USP 2.5% should be used in these patients.

5.3 Elevation in Blood Pressure
A significant elevation in blood pressure is not common but has been reported following conjunctival instillation of recommended doses of phenylephrine 10%. The risk is less with phenylephrine 2.5%. Caution should be exercised with the use of phenylephrine 10% in pediatric patients less than 5 years of age and patients with hyperthyroidism, or cardiovascular disease. The post-treatment blood pressure of patients with cardiac and endocrine diseases and any patients who develop symptoms should be carefully monitored.

5.4 Rebound Miosis
Rebound miosis has been reported one day after receiving phenylephrine hydrochloride ophthalmic solution, and re instillation of the drug produced a lesser mydriatic effect.

6 ADVERSE REACTIONS
The following serious adverse reactions are described below and elsewhere in the labeling:
• Cardiac Disease [See Warnings and Precautions (5.2)]
• Elevation in Blood Pressure [See Warnings and Precautions (5.3)]
The following adverse reactions have been identified following use of phenylephrine hydrochloride ophthalmic solution. Because these reactions are reported voluntarily
from a population of uncertain size, it is not always possible to reliably estimate their frequency or establish a causal relationship to drug exposure.

6.1 Ocular Adverse Reactions
Eye pain and stinging on instillation, temporary blurred vision and photophobia, and conjunctival sensitization may occur.

6.2 Systemic Adverse Reactions
A marked increase in blood pressure has been reported particularly, but not limited to low weight premature neonates, infants and hypertensive patients.

Cardiovascular reactions which have occurred primarily in hypertensive patients following topical ocular use of phenylephrine hydrochloride ophthalmic solution 10% solution include marked increase in blood pressure, syncope, myocardial infarction, tachycardia, arrhythmia and subarachnoid hemorrhage. [See Warnings and Precautions (5.2 and 5.3)]

7 DRUG INTERACTIONS

7.1 Agents That May Exaggerate Pressor Responses
Concomitant use of phenylephrine and atropine may enhance the pressor effects and induce tachycardia in some patients. Phenylephrine may potentiate the cardiovascular depressant effects of some inhalation anesthetic agents.

8 USE IN SPECIFIC POPULATIONS

8.1 Pregnancy
Pregnancy Category C: Animal reproduction studies have not been conducted with topical phenylephrine. It is also not known whether phenylephrine can cause fetal harm when administered to a pregnant woman or can affect reproduction capacity. Phenylephrine hydrochloride should be given to a pregnant woman only if clearly needed.

8.3 Nursing Mothers
It is not known whether this drug is excreted in breast milk. Because many drugs are excreted in human milk, caution should be exercised when Phenylephrine Hydrochloride Ophthalmic Solution, 2.5% and 10% is administered to a nursing woman.

8.4 Pediatric Use
Phenylephrine Hydrochloride Ophthalmic Solution, 10% is contraindicated in pediatric patients less than 1 year of age/infants. Phenylephrine Hydrochloride Ophthalmic Solution, 2.5% should be used in these patients [See 4.2 Contraindications].

8.5 Geriatric Use
No overall differences in safety and effectiveness have been observed between elderly and younger adult patients.

10. OVERDOSAGE
Overdosage of phenylephrine may cause a rapid rise in blood pressure. It may also cause headache, anxiety, nausea, and vomiting, and ventricular arrhythmias. Prompt injection of a rapidly acting alpha-adrenergic blocking agent such as phentolamine has been recommended.
11 DESCRIPTION
Phenylephrine Hydrochloride Ophthalmic Solution, USP 2.5% and 10% is a sterile, clear, colorless, topical mydriatic agent for ophthalmic use. The chemical name is (R)-3-hydroxy-α-[(methylamino)methyl]benzenemethanol hydrochloride. Phenylephrine hydrochloride is represented by the following structural formula:

Phenylephrine hydrochloride has a molecular weight of 203.67 and an empirical formula of C₉H₁₃NO₂·HCl.

Each mL of Phenylephrine Hydrochloride Ophthalmic Solution, 2.5% contains: ACTIVE: phenylephrine hydrochloride 25 mg (2.5%); INACTIVES: sodium phosphate monobasic, sodium phosphate dibasic; boric acid, water for injection. Hydrochloric acid and/or sodium hydroxide may be added to adjust pH (6.0-6.4). The solution has a tonicity of 500 mOsm/kg. PRESERVATIVE: benzalkonium chloride 0.01%.

Each mL of Phenylephrine Hydrochloride Ophthalmic Solution, 10% contains: ACTIVE: phenylephrine hydrochloride 100 mg (10.0%); INACTIVES: sodium phosphate monobasic, sodium phosphate dibasic; water for injection. Hydrochloric acid and/or sodium hydroxide may be added to adjust pH (6.3-6.7). The solution has a tonicity of 1000 mOsm/kg. PRESERVATIVE: benzalkonium chloride 0.01%.

12 CLINICAL PHARMACOLOGY

12.1 Mechanism of Action
Phenylephrine is an alpha-1 adrenergic receptor agonist used for dilation of the pupil due to its vasoconstrictor and mydriatic action. Phenylephrine possesses predominantly α-adrenergic effects. In the eye, phenylephrine acts locally as a potent vasoconstrictor and mydriatic, by constricting ophthalmic blood vessels and the radial muscle of the iris.

12.2 Pharmacodynamics
Maximal mydriasis occurs in 20 to 90 minutes with recovery after 3 to 8 hours.

Systemic absorption of sufficient quantities of phenylephrine may lead to systemic α-adrenergic effects, such as rise in blood pressure which may be accompanied by a reflex atropine-sensitive bradycardia.

12.3 Pharmacokinetics
The systemic exposure following topical administration of phenylephrine hydrochloride ophthalmic solution has not been studied. A higher systemic absorption is expected for the 10% solution than the 2.5% solution and when the corneal barrier function is compromised.

14 CLINICAL STUDIES
Pupillary dilation following topical administration of phenylephrine hydrochloride ophthalmic solution has been demonstrated in controlled clinical studies in adults and pediatric patients with different levels of iris pigmentation. Pupil movement is generally seen within 15 minutes, maximal mydriasis between 20 to 90 minutes and recovery after 3 to 8 hours. Darker irides tend to dilate slower than lighter irides.

16 HOW SUPPLIED/STORAGE AND HANDLING
Phenylephrine Hydrochloride Ophthalmic Solution, USP 2.5% is supplied as a sterile, aqueous, topical ophthalmic solution with a fill volume of 15 mL in a 15 mL opaque, white low density polyethylene (LDPE) bottle with a linear low density polyethylene (LLDPE) dropper tip and red cap. (NDC 42702-102-15)

Phenylephrine Hydrochloride Ophthalmic Solution, USP 10% is supplied as a sterile, aqueous, topical ophthalmic solution with a fill volume of 5 mL in a 10 mL opaque, white LDPE bottle with a LLDPE dropper tip and red cap. (NDC 42702-103-05)

**Storage:**

Store in a refrigerator at 2° to 8°C (36°-46°F).

17 PATIENT COUNSELING INFORMATION

Advise patients not to touch the dropper tip to any surface as this may contaminate the solution.

Inform patients they may experience sensitivity to light and should protect their eyes in bright illumination while their pupils are dilated.
